

Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-6 LXT and SXT FPGAs
- Four 1.25 GHz 16-bit D/As
- Four digital upconverters
- Extended interpolation range from 2x to 1,048,576x
- Programmable output levels
- 250 MHz max. output bandwidth
- 2 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- Dual-μSync clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional front panel LVDS connections to the Virtex-6 FPGA for custom I/O

General Information

Model 56671 is a member of the Cobalt® family of high-performance AMC modules based on the Xilinx Virtex-6 FPGA. This 4-channel, high-speed data converter is suitable for connection to transmit HF or IF ports of a communications or radar system. Its built-in data playback features offer an ideal turnkey solution for demanding transmit applications.

It includes four D/As with a wide range of programmable interpolation factors, four digital upconverters and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56671 includes a front panel general-purpose connector for application-specific I/O.

The Cobalt Architecture

The Pentek Cobalt Architecture features a Virtex-6 FPGA. All of the board's data and control paths are accessible by the FPGA, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Cobalt Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Cobalt family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56671 factory-installed functions include four D/A waveform playback IP modules, to support waveform generation through

the D/A converters. IP modules for DDR3 SDRAM memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56671 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

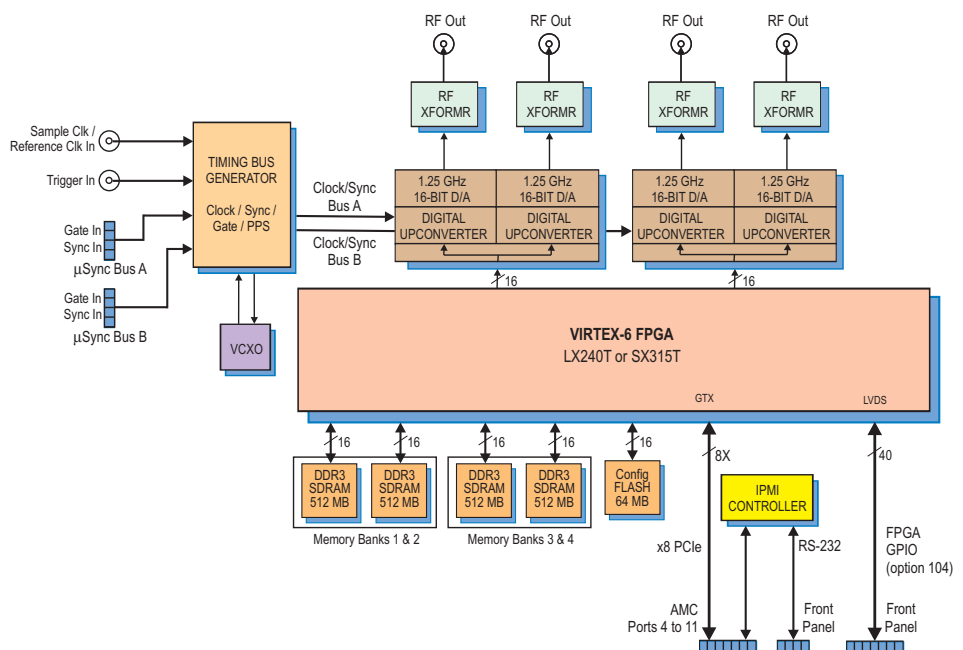

Extendable IP Design

For applications that require specialized functions, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

Xilinx Virtex-6 FPGA

The Virtex-6 FPGA site can be populated with two different FPGAs to match the specific requirements of the processing task. Supported FPGAs include: LX240T or SX315T. The SXT part features 1344 DSP48E slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources, the lower-cost LXT FPGA can be installed.

Option -104 installs a front panel connector with 20 pairs of LVDS connections to the FPGA for custom I/O. ➤

► Digital Upconverter and D/A Stage

Two Texas Instruments DAC3484s provide four DUC (digital upconverter) and D/A channels. Each channel accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and D/A stage.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to a user selectable IF center frequency. It delivers real or quadrature (I+Q) analog outputs to a 16-bit D/A converter.

If translation is disabled, each D/A acts as an interpolating 16-bit D/A with output sampling rates up to 1.25 GHz. In both modes, the D/A provides interpolation factors of 2x, 4x, 8x and 16x. In addition to the DAC3484, the 56671 features an FPGA-based interpolation engine which adds two additional interpolation stages programmable from 2x to 256x. The combined interpolation results in a range from 2x to 1,048,576x for each D/A channel and is ideal for matching the digital downconversion and data reduction used on the receiving channels of many communications systems. Analog output is through four front panel SSMC connectors.

Clocking and Synchronization

An internal timing bus provides all required D/A clocking. The bus includes a clock, sync and a gate or trigger signal. An

on-board clock generator receives a sample clock either from the front panel SSMC connector or from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this latter mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock to phase-lock the VCXO. Either clock source (front panel or VCXO) can be used directly or can be divided by 2, 4, 8, or 16 to provide lower frequency D/A clocks.

A pair of front panel µSync connectors allows multiple boards to be synchronized. They accept CML inputs that drive the board's sync and trigger/gate signals. The Pentek Models 5692 or 9192 Cobalt Synchronizers can drive multiple 56671 µSync connectors enabling large, multi-channel synchronous configurations.

Memory Resources

The 56671 architecture supports four independent memory banks of DDR3 SDRAM. Each bank is 512 MB deep and is an integral part of the module's DMA and waveform playback capabilities. Waveform tables can be loaded into the memories with playback managed by the linked-list controllers.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes. ►

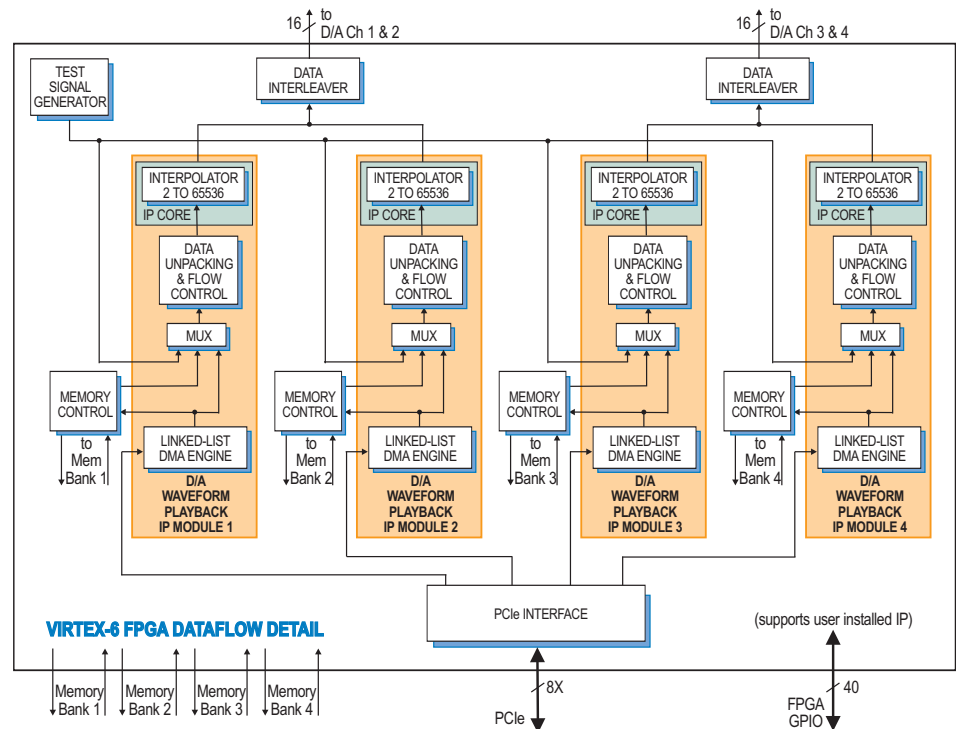

D/A Waveform Playback IP Module

The Model 56671 factory-installed functions include a sophisticated D/A Waveform Playback IP module. Four linked-list controllers support waveform generation to the four D/As from tables stored in either on-board memory or off-board host memory.

Data for Channel 1 and Channel 2 are interleaved for delivery to a dual channel D/A device. For this reason, they must share a common trigger/gate, sample rate, interpolation factor, and other parameters. The same rules apply to Channel 3 and Channel 4.

Parameters including length of waveform, waveform repetition, etc. can be programmed for each channel.

Up to 64 individual link entries for each D/A channel can be chained together to create complex waveforms with a minimum of programming.

► AMC Interface

The Model 56671 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or μ TCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

PCI Express Interface

The Model 56671 includes an industry-standard interface fully compliant with PCI Express Gen. 1 & 2 bus specifications. The x8 lane interface includes multiple DMA controllers for efficient transfers to and from the module.

Specifications

D/A Converters

Type: TI DAC3484

Input Data Rate: 312.5 MHz max.

Output Bandwidth: 250 MHz max.

Output Sampling Rate: 1.25 GHz max. with interpolation

Interpolation: 2x, 4x, 8x or 16x

Resolution: 16 bits

Digital Interpolator

Interpolation Range: 2x to 65,536x in two stages of 2x to 256x

Front Panel Analog Signal Outputs

Quantity: Four D/A outputs

Output Type: Transformer-coupled, front panel female SSMC connectors

Full Scale Output: Programmable from -20 dBm (0.063 Vp-p) to +4 dBm (1.0 Vp-p) in 16 steps

Full Scale Output Programming: $1.0 \times (G+1) / 16$ Vp-p, where 4-bit integer $G = 0$ to 15

Ordering Information

Model	Description
56671	4-Channel 1.25 GHz D/A with DUC, Extended Interpolation and Virtex-6 FPGA - AMC

Options:

-002*	-2 FPGA speed grade
-062	XC6VLX240T FPGA
-064	XC6VSX315T FPGA
-104	LVDS FPGA I/O through front panel connector
-155*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 1 and 2)
-165*	Two 512 MB DDR3 SDRAM Memory Banks (Banks 3 and 4)

* These options are always required

Contact Pentek for availability of rugged and conduction-cooled versions

Clock Synthesizer

Clock Source: Selectable from on-board programmable VCXO or front panel external clock

VCXO Frequency Ranges: 10 to 945 MHz, 970 to 1134 MHz and 1213 to 1417 MHz

Synchronization: VCXO can be phase-locked to an external 4 to 200 MHz system reference, typically 10 MHz

Clock Dividers: External clock or VCXO can be divided by 1, 2, 4, 8, or 16 for the D/A clock

External Clock

Type: Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 500 MHz sample clock or 5 or 10 MHz system reference

External Trigger Input

Type: Front panel female SSMC connector
Function: Programmable functions include: trigger, gate, sync and PPS

Timing Bus: 19-pin μ Sync bus connector includes, clock, reset and gate/trigger inputs and outputs, CML

Field Programmable Gate Array:

Xilinx Virtex-6 XC6VLX240T-2 or XC6VSX315T-2

Custom I/O

Option -104: Installs a front panel connector with 20 LVDS pairs to the FPGA

Memory: Four 512 MB DDR3 SDRAM memory banks, 400 MHz DDR

PCI-Express Interface

PCI Express Bus: Gen. 1 or Gen 2: x4 or x8;

AMC Interface

Type: AMC.1

Module Management: IPMI Version 2.0

Environmental

Operating Temp: 0° to 50° C

Storage Temp: -20° to 90° C

Relative Humidity: 0 to 95%, non-cond.

Size: Single-width, full-height AMC module, 2.89 in. x 7.11 in.
