Model 56751

2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and a Virtex-7 FPGA - AMC

Onyx
GateXpress
GateFlow
ReadyFlow Board Support Package

Features

- Complete radar and software radio interface solution
- Supports Xilinx Virtex-7 VXT FPGAs
- GateXpress supports dynamic FPGA reconfiguration across PCIe
- Two 500 MHz 12-bit A/Ds
- Two multiband DDCs (digital downconverters)
- One DUC (digital upconverter)
- Two 800 MHz 16-bit D/As
- 4 GB of DDR3 SDRAM
- Sample clock synchronization to an external system reference
- LVPECL clock/sync bus for multimodule synchronization
- PCI Express (Gen. 1 & 2) interface up to x8
- AMC.1 compliant
- IPMI 2.0 compliant MMC (Module Management Controller)
- Optional LVDS connections to the Virtex-7 FPGA for custom I/O
- Optional 400 MHz 14-bit A/Ds

General Information

Model 56751 is a member of the Onyx® family of high performance AMC modules based on the Xilinx Virtex-7 FPGA. A multi-channel, high-speed data converter with a programmable DDC, it is suitable for connection to HF or IF ports of a communications or radar system. Its built-in data capture and playback features offer an ideal turnkey solution as well as a platform for developing and deploying custom FPGA processing IP.

It includes two A/Ds, two D/As and four banks of memory. In addition to supporting PCI Express Gen. 2 as a native interface, the Model 56751 includes a general-purpose front-panel connector for application-specific I/O.

The Onyx Architecture

Based on the proven design of the Pentek Cobalt family, Onyx raises the processing performance with the new flagship family of Virtex-7 FPGAs from Xilinx. As the central feature of the board architecture, the FPGA has access to all data and control paths, enabling factory-installed functions including data multiplexing, channel selection, data packing, gating, triggering and memory control. The Onyx Architecture organizes the FPGA as a container for data processing applications where each function exists as an intellectual property (IP) module.

Each member of the Onyx family is delivered with factory-installed applications ideally matched to the board's analog interfaces. The 56751 factory-installed functions include two A/D acquisition and a D/A waveform playback IP modules. Each of the two acquisition IP modules contains a powerful, programmable DDC IP core. The waveform playback IP module contains an interpolation IP core, ideal for matching playback rates to the data and decimation rates of the acquisition modules. IP modules for DDR3 memories, a controller for all data clocking and synchronization functions, a test signal generator, and a PCIe interface complete the factory-installed functions and enable the 56751 to operate as a complete turnkey solution, without the need to develop any FPGA IP.

Extendable IP Design

For applications that require specialized function, users can install their own custom IP for data processing. Pentek GateFlow FPGA Design Kits include all of the factory-installed modules as documented source code. Developers can integrate their own IP with the Pentek factory-installed functions or use the GateFlow kit to completely replace the Pentek IP with their own.

Xilinx Virtex-7 FPGA

The Virtex-7 FPGA site can be populated with one of two FPGAs to match the specific requirements of the processing task. Supported FPGAs are VX330T or VX690T. The VX690T features 3600 DSP48E1 slices and is ideal for modulation/demodulation, encoding/decoding, encryption/decryption, and channelization of the signals between transmission and reception. For applications not requiring large DSP resources or logic, the lower-cost VX330T can be installed.

Option -104 installs a front panel connector with 24 pairs of LVDS connections to the FPGA for custom I/O. ➤

Model 56751

2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and a Virtex-7 FPGA - AMC

A/D Acquisition IP Modules

The 56751 features two A/D Acquisition IP Modules for easily capturing and moving data. Each module can receive data from either of the two A/Ds, a test signal generator or from the D/A Waveform Playback IP Module in loopback mode.

Each IP module has an associated memory bank for buffering data in FIFO mode or for storing data in transient capture mode. All memory banks are supported with DMA engines for easily moving A/D data through the PCIe interface.

These powerful linked-list DMA engines are capable of a unique Acquisition Gate Driven mode. In this mode, the length of a transfer performed by a link definition need not be known prior to data acquisition; rather, it is governed by the length of the acquisition gate. This is extremely useful in applications where an external gate drives acquisition and the exact length of that gate is not known or is likely to vary.

For each transfer, the DMA engine can automatically construct metadata packets containing A/D channel ID, a sample-accurate time stamp and data length information. These actions simplify the host processor's job of identifying and executing on the data.

DDC IP Cores

Within each A/D Acquisition IP Module is a powerful DDC IP core. Because of the flexible input routing of the A/D Acquisition IP Modules, many different configurations can be achieved including one A/D driving both DDCs or each of the two A/Ds driving its own DDC.

Each DDC has an independent 32-bit tuning frequency setting that ranges from DC to f_s, where f_s is the A/D sampling frequency. Each DDC can have its own unique decimation setting, supporting as many as two different output bandwidths for the board. Decimations can be programmed from 2 to 131,072 providing a wide range to satisfy most applications.

The decimating filter for each DDC accepts a unique set of user-supplied 16-bit coefficients. The 80% default filters deliver an output bandwidth of $0.8*f_s/N$, where N is the decimation setting. The rejection of adjacent-band components within the 80% output bandwidth is better than 100 dB. Each DDC delivers a complex output stream consisting of 24-bit I + 24-bit Q or16-bit I + 16-bit Q samples at a rate of f_s/N.

D/A Waveform Playback IP Module

The Model 56751 factory-installed functions include a sophisticated D/A Waveform Playback IP module. A linked-list controller allows users to easily play back to the dual D/As waveforms stored in either on-board memory or off- board host memory.

Parameters including length of waveform, delay from playback trigger, waveform repetition, etc. can be programmed for each waveform.

Up to 64 individual link entries can be chained together to create complex waveforms with a minimum of programming.

➤ GateXpress for FPGA Configuration

The Onyx architecture includes GateXpress, a sophisticated FPGA-PCIe configuration manager for loading and reloading the FPGA. At power up, GateXpress immediately presents a PCIe target for the host computer to discover, effectively giving the FPGA time to load from FLASH. This is especially important for larger FPGAs where the loading times can exceed the PCIe discovery window, typically 100 msec on most PCs.

The board's configuration FLASH can hold four FPGA images. Images can be factory-installed IP or custom IP created by the user, and programmed into the FLASH via JTAG using Xilinx iMPACT or through the board's PCIe interface. At power up the user can choose which image will load based on a hardware switch setting.

Once booted, GateXpress allows the user three options for dynamically reconfiguring the FPGA with a new IP image. The first is the option to load an alternate image from FLASH through software control. The user selects the desired image and issues a reload command.

The second option is for applications where the FPGA image must be loaded directly through the PCIe interface. This is important in security situations where there can be no latent user image left in nonvolatile memory when power is removed. In applications where the FPGA IP may need to change many times during the course ➤

➤ of a mission, images can be stored on the host computer and loaded through PCIe as needed.

The third option, typically used during development, allows the user to directly load the FPGA through JTAG using Xilinx iMPACT.

In all three FPGA loading scenarios, GateXpress handles the hardware negotiation simplifying and streamlining the loading task. In addition, GateXpress preserves the PCIe configuration space allowing dynamic FPGA reconfiguration without needing to reset the host computer to rediscover the board. After the reload, the host simply continues to see the board with the expected device ID.

A/D Converter Stage

The front end accepts two analog HF or IF inputs on front panel SSMC connectors with transformer coupling into two Texas Instruments ADS5463 500 MHz, 12-bit A/D converters. Optionally, a Texas Instruments ADS5474 400 MHz, 14-bit A/D may be installed.

The digital outputs are delivered into the Virtex-7 FPGA for signal processing, data capture and for routing to other module resources.

Digital Upconverter and D/A Stage

A TI DAC5688 DUC (digital upconverter) and D/A accepts a baseband real or complex data stream from the FPGA and provides that input to the upconvert, interpolate and dual D/A stages.

When operating as a DUC, it interpolates and translates real or complex baseband input signals to any IF center frequency up to 360 MHz. It delivers real or quadrature (I+Q) analog outputs to the dual 16-bit D/A converter. Analog output is through a pair of front panel SSMC connectors.

If translation is disabled, the DAC5688 acts as a dual interpolating 16-bit D/A with output sampling rates up to 800 MHz. In both modes the DAC5688 provides interpolation factors of 2x, 4x and 8x. In addition to the DAC5688, an FPGA-based interpolator core provides additional interpolation from 2x to 65,536x. The two interpolators can be combined to create a total range from 2x to 524,288x.

Clocking and Synchronization

Two internal timing buses provide either a single clock or two different clock rates to the A/D and D/A signal paths.

Each timing bus includes a clock, sync and a gate or trigger signal. An on-board clock generator receives an external sample clock from the front panel SSMC connector. This clock can be used directly for either the A/D or D/A sections or can be divided by a built-in clock synthesizer circuit to provide different A/D and D/A clocks. In an alternate mode, the sample clock can be sourced from an on-board programmable VCXO (Voltage-Controlled Crystal Oscillator). In this mode, the front panel SSMC connector can be used to provide a 10 MHz reference clock for synchronizing the internal oscillator.

A front panel 26-pin LVPECL Clock/Sync connector allows multiple modules to be synchronized. In the slave mode, it accepts LVPECL inputs that drive the clock, sync and gate signals. In the master mode, the LVPECL bus can drive the timing signals for synchronizing multiple modules.

Multiple 56751's can be driven from the LVPECL bus master, supporting synchronous sampling and sync functions across all connected modules.

Memory Resources

The 56751 architecture supports four independent DDR3 SDRAM memory banks. Each bank is 1 GB deep and is an integral part of the module's DMA capabilities, providing FIFO memory space for creating DMA packets. Built-in memory functions include multichannel A/D data capture, tagging and streaming.

In addition to the factory-installed functions, custom user-installed IP within the FPGA can take advantage of the memories for many other purposes.

AMC Interface

The Model 56650 complies with the AMC.1 specification by providing an x8 PCIe connection to AdvancedTCA carriers or µTCA chassis. Module management is provided by an IPMI 2.0 MMC (Module Management Controller).

PCI Express Interface

The Model 56751 includes an industry-standard interface fully compliant with PCI Express Gen. 1 and 2 bus specifications. Supporting PCIe links up to x8, the interface includes multiple DMA controllers for efficient transfers to and from the module. ➤

Model 56751

2-Channel 500 MHz A/D, DDC, DUC, 2-Channel 800 MHz D/A and a Virtex-7 FPGA - AMC

➤ Specifications

Front Panel Analog Signal Inputs
- **Input Type:** Transformer-coupled, front panel female SSMC connectors
- **Transformer Type:** Coil Craft WBC4-6TLB
- **Full Scale Input:** +5 dBm into 50 ohms
- **3 dB Passband:** 300 kHz to 700 MHz

A/D Converters (standard)
- **Type:** Texas Instruments ADS5463
- **Sampling Rate:** 20 MHz to 500 MHz
- **Resolution:** 12 bits

A/D Converters (option -014)
- **Type:** Texas Instruments ADS5474
- **Sampling Rate:** 20 MHz to 400 MHz
- **Resolution:** 14 bits

Digital Downconverters
- **Quantity:** Two channels
- **Decimation Range:** 2x to 131,072x in two programmable stages of 2x to 256x and one fixed 2x stage
- **LO Tuning Freq. Resolution:** 32 bits, 0 to f_s
- **LO SFDR:** >120 dB
- **Phase Offset Resolution:** 32 bits, 0 to 360 degrees
- **FIR Filter:** 16-bit coefficients, 24-bit output, with user programmable coefficients
- **Default Filter Set:** 80% bandwidth, <0.3 dB passband ripple, >100 dB stopband attenuation

D/A Converters
- **Type:** Texas Instruments DAC5688
- **Input Data Rate:** 250 MHz max.
- **Output IF:** DC to 400 MHz max.
- **Output Signal:** 2-channel real or 1-channel with frequency translation
- **Output Sampling Rate:** 800 MHz max. with 2x, 4x or 8x interpolation
- **Resolution:** 16 bits

Digital Interpolator
- **Interpolation Range:** 2x to 65,536x in two stages of 2x to 256x

Total Interpolation Range (D/A and Digital combined): 2x to 524,288x

Front Panel Analog Signal Outputs
- **Output:** Transformer-coupled, front panel female SSMC connectors
- **Transformer:** Coil Craft WBC4-6TLB
- **Full Scale Output:** +4 dBm into 50 ohms
- **3 dB Passband:** 300 kHz to 700 MHz

Sample Clock Sources: On-board clock synthesizer generates two clocks: one A/D clock and one D/A clock

Clock Synthesizer
- **Clock Source:** Selectable from on-board programmable VCXO (10 to 810 MHz), front panel external clock or LVPECL timing bus
- **Synchronization:** VCXO can be locked to an external 4 to 180 MHz PLL system reference, typically 10 MHz
- **Clock Dividers**: External clock or VCXO can be divided by 1, 2, 4, 8, or 16, independently for the A/D clock and D/A clock

External Clock
- **Type:** Front panel female SSMC connector, sine wave, 0 to +10 dBm, AC-coupled, 50 ohms, accepts 10 to 800 MHz divider input clock or PLL system reference

Timing Bus: 26-pin connector LVPECL bus includes, clock/sync/gate/PPS inputs and outputs; TTL signal for gate/trigger and sync/PPS inputs

Field Programmable Gate Array
- **Standard:** Xilinx Virtex-7 XC7VX330T-2
- **Optional:** Xilinx Virtex-7 XC7VX690T-2

Custom I/O
- **Option -104:** Installs a front panel connector with 24 LVDS pairs to the FPGA

Memory
- **Type:** DDR3 SDRAM
- **Size:** Four banks, 1 GB each
- **Speed:** 800 MHz (1600 MHz DDR)

PCI-Express Interface
- **PCI Express Bus:** Gen.1 or Gen.2, x4 or x8

AMC Interface
- **Type:** AMC.1
- **Module Management:** IPMI Version 2.0

Environmental
- **Operating Temp:** 0° to 50° C
- **Storage Temp:** –20° to 90° C
- **Relative Humidity:** 0 to 95%, non-cond.

Size: Single-width, full-height AMC module, 2.89 in. x 7.11 in.

Ordering Information

Model	Description
56751	2-Channel 500 MHz A/D with DDC, DUC with 2-Channel 800 MHz D/A, and a Virtex-7 FPGA - AMC
Options:	
-014	400 MHz, 14-bit A/Ds
-076	XC7VX690T-2 FPGA
-104	LVDS FPGA I/O through P14 connector
-105	Gigabit serial FPGA I/O through P16 connector
